Interface Segregation Principle

Interface Segregation Principle

Clients should not be forced to depend on methods that they do not use.

–Agile Software Development; Robert C. Martin; Prentice Hall, 2003

Introduction by Example

- Consider the development of software for an automatic teller machine (ATM):
 - Support for the following types of transactions is required: **withdraw**, **deposit**, and **transfer**.
 - Support for different **languages** and support for different **kinds of UIs** is also required
 - Each transaction class needs to call methods on the GUI
E.g., to ask for the amount to deposit, withdraw, transfer.

3

Introduction by Example

- Initial design of a software for an automatic teller machine (ATM):

What do you think?

4

ISP tells us to avoid this. Each transaction class uses a part of the interface, but depends on all others. Any change affects all transactions.

A Polluted Interface

ATM UI is a polluted interface!

- It declares methods that do not belong together.
- It forces classes to depend on unused methods and therefore depend on changes that should not affect them.
- ISP states that such interfaces should be split.

```
«interface»
ATM UI
+ requestDepositAmount ()
+ requestWithdrawalAmount ()
+ requestTransferAmount ()
+ informInsufficientFunds ()
```

5

This causes coupling between all clients!

The Rationale Behind ISP

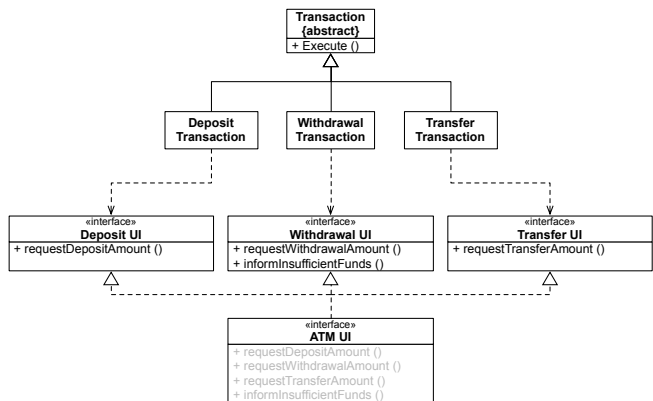

When clients depend on methods they do not use, they **become subject to changes forced upon these methods** by other clients.

6

How does an ISP compliant solution look like?

An ISP Compliant Solution

Try to group possible clients
of a class and have an
interface for each group.

Segregating interfaces should not be overdone!

If you overdue the application of the interface segregation principle, you will end up with $2n-1$ interfaces for a class with n methods.

Recall that, in general, a class implementing many interfaces may be a sign of a violation of the single-responsibility principle.

Try to group possible clients
of a class and have an
interface for each group.

Interface Segregation Principle

Clients should not be forced to depend on methods that they do not use.
